15.0	2.87	43.0	
20.0	2.55	51.0	
25.0	2.32	58.0	

* Please be aware the dissipated power P_d is not the same as the electrical power Pe of a LED module.

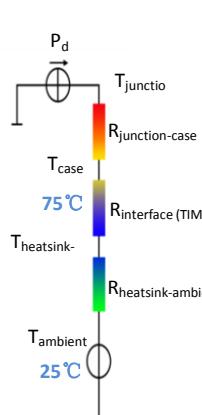

*To calculate the dissipated power please use the following formula: $P_d = Pe \times (1-\eta L)$.

P_d - Dissipated power ; Pe - Electrical power ; ηL = Light efficiency of the LED module;

*The aluminum substrate side of the package outer shell is thermally connected to the heat sink via TIM (Thermal interface material).

MingFa recommends the use of a high thermal conductive interface between the LED module and the LED cooler.

Either thermal grease,A thermal pad or a phase change thermal pad thickness 0.1-0.15mm is recommended.

*Thermal resistance is a heat property and a measurement of a temperature difference by which an object or material resists a heat flow.

Geometric shapes are different, the thermal resistance is different. Formula: $\theta = (Ths - Ta)/Pd$

θ - Thermal Resistance [$^{\circ}\text{C}/\text{W}$] ; Ths - Heatsink temperature ; Ta - Ambient temperature ;

*The thermal resistance between the junction section of the light-emitting diode and the aluminum substrate side of the package outer shell is $R_{junction-case}$, the thermal resistance of the TIM outside the package is $R_{interface(TIM)}$ [$^{\circ}\text{C}/\text{W}$], the thermal resistance with the

heat sink is $R_{heatsink-ambient}$ [$^{\circ}\text{C}/\text{W}$], and the ambient temperature is $T_{ambient}$ [$^{\circ}\text{C}$].

*Thermal resistances outside the package $R_{interface(TIM)}$ and $R_{heatsink-ambient}$ can be integrated

into the thermal resistance $R_{case-ambient}$ at this point.Thus, the following formula is also used:

$$T_{junction} = (R_{junction-case} + R_{case-ambient}) \cdot Pd + T_{ambient}$$
