## *SimpoLED* SimpoLED-58 Series $\Phi 58\text{mm}$ Material AL6063-T5 COB Star Heat Sinks Thermal Data

### The thermal data table

#### SimpoLED-58 thermal data

Dissipated Power Pd(W)	Heat sink to ambient temperature rise Ths-amb (°C)	
	SimpoLED-5850	SimpoLED-5870
2	14.5	10.0
4	25.0	16.0
6	34.5	22.0
8	43.0	28.0
10	51.0	32.5
12	58.0	37.5
20		55.3

\* Please be aware the dissipated power Pd is not the same as the electrical power Pe of a LED module.

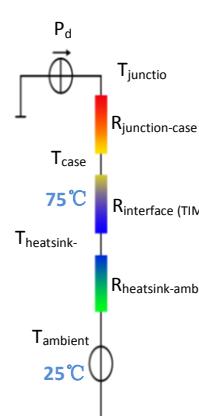

\*To calculate the dissipated power please use the following formula:  $P_d = Pe \times (1-\eta L)$ .

Pd - Dissipated power ; Pe - Electrical power ;  $\eta L$  = Light efficiency of the LED module;

\*The aluminum substrate side of the package outer shell is thermally connected to the heat sink via TIM (Thermal interface material).

MingFa recommends the use of a high thermal conductive interface between the LED module and the LED cooler.

Either thermal grease,A thermal pad or a phase change thermal pad thickness 0.1-0.15mm is recommended.

\*Thermal resistance is a heat property and a measurement of a temperature difference by which an object or material resists a heat flow.

Geometric shapes are different, the thermal resistance is different. Formula:  $\theta = (Ths - Ta)/Pd$

$\theta$  - Thermal Resistance [°C/W] ; Ths - Heatsink temperature ; Ta - Ambient temperature ;

\*The thermal resistance between the junction section of the light-emitting diode and the aluminum substrate side of the package outer

shell is  $R_{junction-case}$ , the thermal resistance of the TIM outside the package is  $R_{interface(TIM)}$  [°C/W], the thermal resistance with the

heat sink is  $R_{heatsink-ambient}$  [°C/W], and the ambient temperature is  $T_{ambient}$  [°C].

\*Thermal resistances outside the package  $R_{interface(TIM)}$  and  $R_{heatsink-ambient}$  can be integrated

into the thermal resistance  $R_{case-ambient}$  at this point.Thus, the following formula is also used:

$$T_{junction} = (R_{junction-case} + R_{case-ambient}) \cdot Pd + T_{ambient}$$
