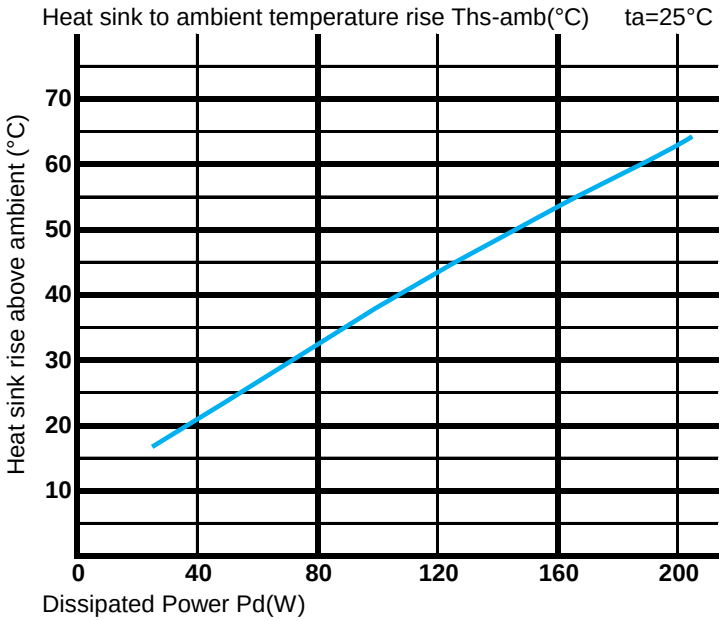
The thermal data table

* Please be aware the dissipated power Pd is not the same as the electrical power Pe of a LED module.

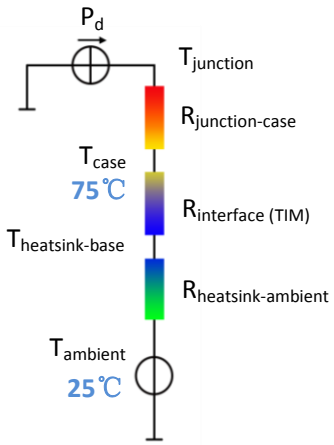
*To calculate the dissipated power please use the following formula: Pd = Pe x (1-ηL).

Pd - Dissipated power ; Pe - Electrical power ; ηL = Light effciency of the LED module;

Pd = Pe x (1-ηL)		Heat sink to ambient thermal resistance Rhs-amb (°C/W)	Heat sink to ambient temperature rise Ths-amb (°C)
		xLED-22560	
Dissipated Power Pd(W)	40.0	0.53	21.0
	80.0	0.41	33.0
	120.0	0.37	44.0
	160.0	0.33	53.0
	200.0	0.32	63.0



*The aluminum substrate side of the package outer shell is thermally connected to the heat sink via TIM (Thermal interface MingFa recommends the use of a high thermal conductive interface between the LED module and the LED cooler. Either thermal grease,A thermal pad or a phase change thermal pad thickness 0.1-0.15mm is recommended.



*Thermal resistance is a heat property and a measurement of a temperature difference by which an object or material resists a heat flow. Geometric shapes are different, the thermal resistance is different.

Formula: $\theta = (Ths - Ta)/Pd$

θ - Thermal Resistance [°C/W] ; Ths - Heatsink temperature ; Ta - Ambient

*The thermal resistance between the junction section of the light-emitting diode and the aluminum substrate side of the package outer shell is $R_{junction\text{-}case}$, the thermal of the TIM outside the package is $R_{interface\ (TIM)}$ [°C/W], the thermal resistance with heat sink is $R_{heatsink\text{-}ambient}$ [°C/W], and the ambient temperature is $T_{ambient}$ [°C].

*Thermal resistances outside the package $R_{interface\ (TIM)}$ and $R_{heatsink\text{-}ambient}$ can be into the thermal resistance $R_{case\text{-}ambient}$ at this point.Thus, the following formula is also used:

$$T_{junction} = (R_{junction\text{-}case} + R_{case\text{-}ambient}) \cdot Pd + T_{ambient}$$
